Bayesian Optimisation for Likelihood Free Inference

Make model parameterisation go brrr

Jacob Cumming

University of Melbourne

April 2024

Notation

- Model is considered a (random) function $f(\theta)$ that maps θ (a vector of parameters) to a model output, that can be transformed into \mathbf{X} , that has the same shape as:
- ➤ X_{obs}, a vector of outputs given to us usually in the forms of summary statistics (incidence, prevalence, hospitalisations etc).

▶ An explicit form for the likelihood: $\mathcal{L}(\theta|\mathbf{X}_{obs}) := \Pr(\mathbf{X}_{obs}|\theta)$

- ▶ An explicit form for the likelihood: $\mathcal{L}(\theta|\mathbf{X}_{obs}) := \Pr(\mathbf{X}_{obs}|\theta)$
- ▶ Or even $\mathcal{L}(\theta|S(\mathbf{X}_{obs})) := \Pr(S(\mathbf{X}_{obs})|\theta)$, where $S(\mathbf{X}_{obs})$ is a (vector of) summary statistic(s)

- ▶ An explicit form for the likelihood: $\mathcal{L}(\theta|\mathbf{X}_{obs}) := \Pr(\mathbf{X}_{obs}|\theta)$
- ▶ Or even $\mathcal{L}(\theta|S(\mathbf{X}_{obs})) := \Pr(S(\mathbf{X}_{obs})|\theta)$, where $S(\mathbf{X}_{obs})$ is a (vector of) summary statistic(s)
- $oldsymbol{\hat{ heta}} = \mathsf{arg}\,\mathsf{max}_{oldsymbol{ heta}}\,\mathcal{L}(oldsymbol{ heta}|\mathcal{S}(\mathbf{X}_\mathsf{obs}))$

- ▶ An explicit form for the likelihood: $\mathcal{L}(\theta|\mathbf{X}_{obs}) := \Pr(\mathbf{X}_{obs}|\theta)$
- ▶ Or even $\mathcal{L}(\theta|S(\mathbf{X}_{obs})) := \Pr(S(\mathbf{X}_{obs})|\theta)$, where $S(\mathbf{X}_{obs})$ is a (vector of) summary statistic(s)
- $m{\hat{ heta}} = \mathsf{arg}\,\mathsf{max}_{m{ heta}}\,\mathcal{L}(m{ heta}|S(\mathbf{X}_\mathsf{obs}))$
- $\blacktriangleright \ \mathsf{Pr}(\theta|S(\mathbf{X}_{\mathsf{obs}})) \propto \mathsf{Pr}(S(\mathbf{X}_{\mathsf{obs}})|\theta) \, \mathsf{Pr}(\theta)$

The Sad Truth

As models become more complicated, explicit likelihoods don't exist (think agent based models).

A Standard Bayesian Solution

- Approximate Bayesian Computation (ABC)
 - 1. Sample from prior
 - 2. Run model
 - Accept or reject parameters run based on how well X 'matches' X_{obs}.

What is 'matches'

- ▶ Discrepency function $D: \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$
 - Can be a norm such as $||S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})||_p := (\sum_{i=1}^d |S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})|^p)^{1/p}$

What is 'matches'

- ▶ Discrepency function $D: \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$
 - Can be a norm such as $||S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})||_p := (\sum_{i=1}^d |S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})|^p)^{1/p}$
 - Care should be taken to rescale $S(\mathbf{X}_{obs})$ and $S(\mathbf{X})$ appropriately (ie via a covariance matrix).

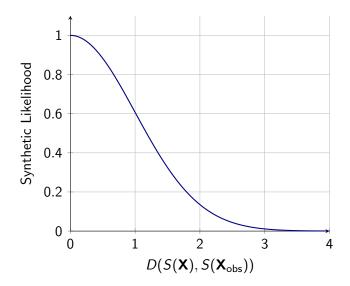

What is 'matches'

- ▶ Discrepency function $D: \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$
 - Can be a norm such as $||S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})||_p := (\sum_{i=1}^d |S(\mathbf{X}) S(\mathbf{X}_{\text{obs}})|^p)^{1/p}$
 - Care should be taken to rescale $S(\mathbf{X}_{obs})$ and $S(\mathbf{X})$ appropriately (ie via a covariance matrix).
- ▶ $D(S(\mathbf{X}), S(\mathbf{X}_{obs}))$, gives acceptance probability of θ .

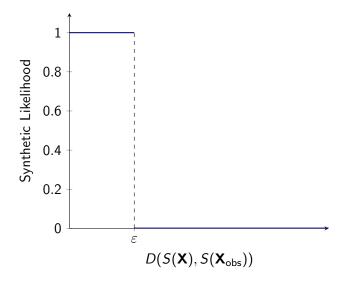

Acceptance Probability

Attempt 2

Overall Idea of my Research

► What if we could 'predict' discrepency values we hadn't seen before?

Overall Idea of my Research

- ► What if we could 'predict' discrepency values we hadn't seen before?
- ► For parameters 'close' to parameters we've already tried it should be easy.

Gaussian Processes

- Random functions
- Common examples Brownian motion, Ornstein Uhlenbeck process

Gaussian Processes on \mathbb{R}^d

Definition (Gaussian Process)

A collection of random variables $\{f(\mathbf{x})\}_{\mathbf{x}\in\mathbb{R}^d}$ is a Gaussian process if all finite dimensional distributions are multivariate normal distributed. That is, there is a function $m: \mathbf{x} \to \mathbb{R}$ and kernel $k: \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ such that for all finite sets $\{\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n\}$,

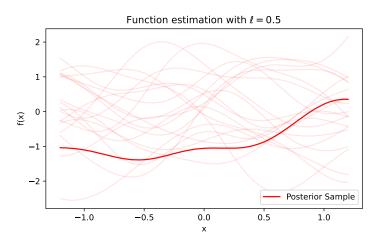

$$\begin{bmatrix} f(\mathbf{x}_1) \\ f(\mathbf{x}_2) \\ \vdots \\ f(\mathbf{x}_n) \end{bmatrix} \sim \mathsf{MVN} \left(\begin{bmatrix} m(\mathbf{x}_1) \\ m(\mathbf{x}_2) \\ \vdots \\ m(\mathbf{x}_n) \end{bmatrix}, \mathbf{K} \right)$$

where

$$\mathbf{K} = \begin{bmatrix} k(\mathbf{x}_1, \mathbf{x}_1) & k(\mathbf{x}_1, \mathbf{x}_2) & \dots & k(\mathbf{x}_1, \mathbf{x}_n) \\ k(\mathbf{x}_2, \mathbf{x}_1) & \ddots & & \vdots \\ \vdots & & \ddots & \vdots \\ k(\mathbf{x}_n, \mathbf{x}_1) & \dots & \dots & k(\mathbf{x}_n, \mathbf{x}_n) \end{bmatrix}$$

Gaussian Process Example Realisations

Covariance Kernel Motivation

- Kernel determines the amount of covariance between sets of indices.
- ▶ When the distance between indices is small, covariance needs to be large

Common Covariance Kernels

Matern Kernel

$$k_{\nu}(x,x') = \sigma^2 \frac{2^{1-\nu}}{\Gamma(\nu)} \left(\frac{\sqrt{2\nu}||x-x'||}{\ell} \right)^{\nu} K_{\nu} \left(-\frac{\sqrt{2\nu}||x-x'||}{\ell} \right)$$

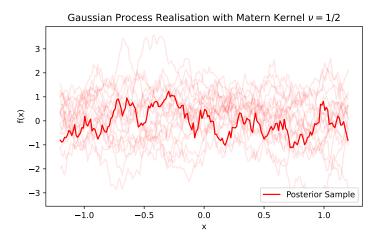

where K_{ν} is a modified Bessel function ($||\cdot||$ is the euclidean distance)

- $ightharpoonup \lfloor
 u
 floor$ times mean square differentiable.
- As $\nu \to \infty$ you get squared exponential covariance function, which results in realisations that are infinitely mean square differentiable:

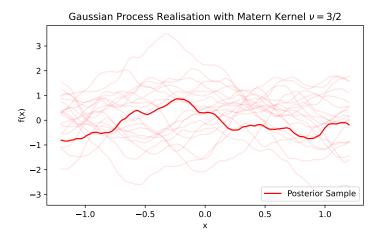

$$k(x, x') = \sigma^2 \exp(-\frac{||x - x'||^2}{\ell})$$

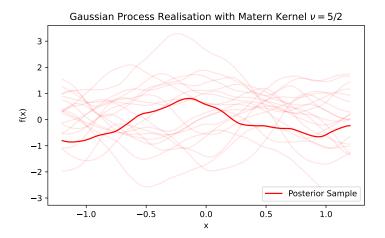

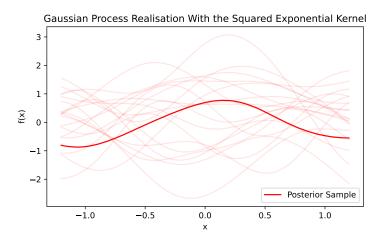

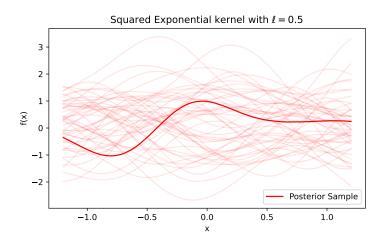

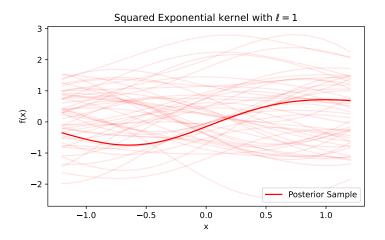

$$k(x, x') = \sigma^2 \exp(-\frac{||x - x'||^2}{\ell})$$

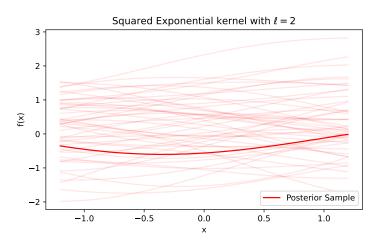

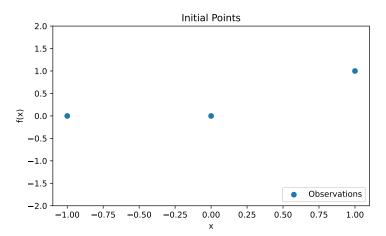

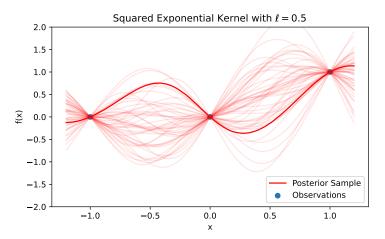

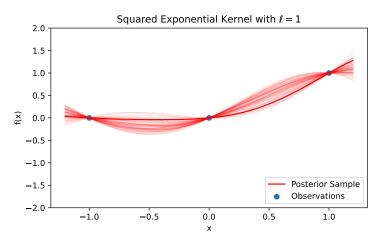

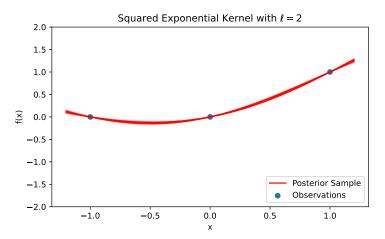

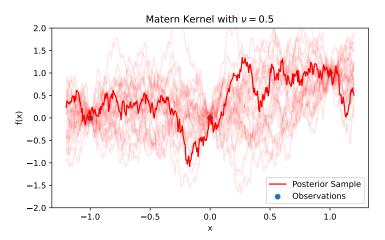

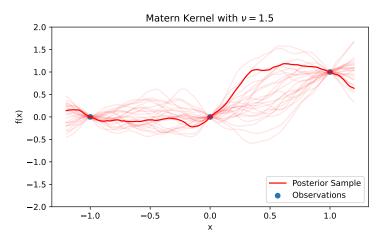

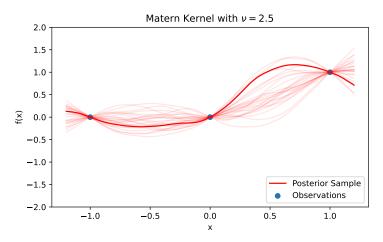

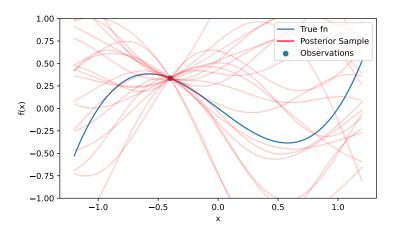

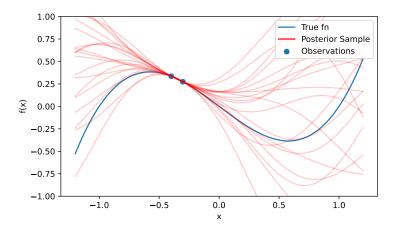

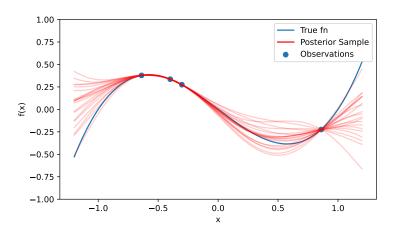

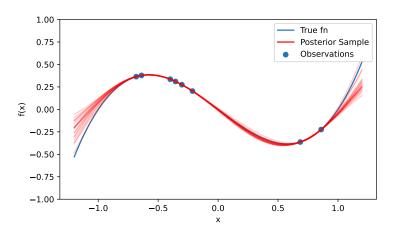

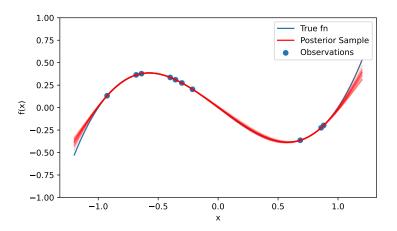

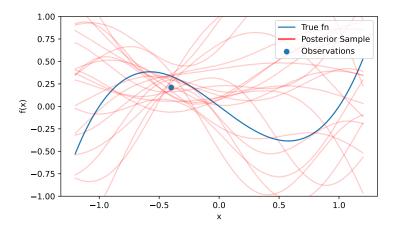

What if we have noise?

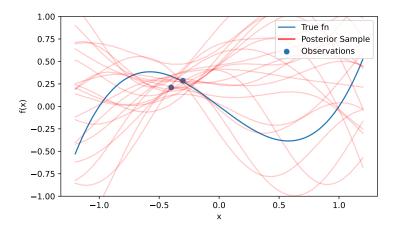

Add in observation variance, so that

$$\begin{bmatrix} f(\mathbf{x}_1) \\ f(\mathbf{x}_2) \\ \vdots \\ f(\mathbf{x}_n) \end{bmatrix} \sim \mathsf{MVN} \begin{pmatrix} \begin{bmatrix} m(\mathbf{x}_1) \\ m(\mathbf{x}_2) \\ \vdots \\ m(\mathbf{x}_n) \end{bmatrix}, \ \mathbf{K} + \sigma^2 \mathbf{I}_n \end{pmatrix}$$

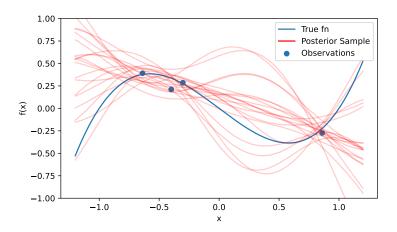

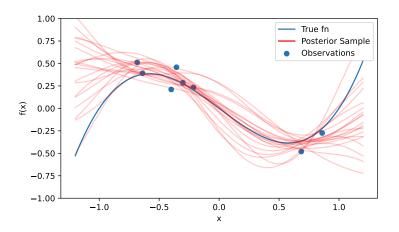

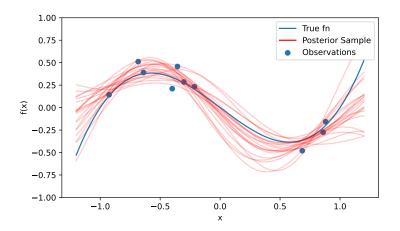

Where to sample function next?

Next point arg min $_{\theta} A(\theta)$ where A is an acquisition function.

Where to sample function next?

- Next point arg min $_{\theta} A(\theta)$ where A is an acquisition function.
- ► BOLFI paper uses

$$\mu(\boldsymbol{\theta}) - \eta_t \sqrt{\mathbf{v}(\boldsymbol{\theta})}$$

- \blacktriangleright $\mu(\theta)$ and $v(\theta)$ are the posterior mean and variance

Where to sample function next?

- Next point arg min $_{\theta}$ $A(\theta)$ where A is an acquisition function.
- BOLFI paper uses

$$\mu(\boldsymbol{\theta}) - \eta_t \sqrt{\mathbf{v}(\boldsymbol{\theta})}$$

- $hline \eta_t := \sqrt{c + 2\ln(t^{d/2+2})}, \text{ and } c \text{ can be chosen}$
- $lackbox{}\mu(m{ heta})$ and $v(m{ heta})$ are the posterior mean and variance
- Could use expected information

$$(\mu_{\min} - \mu(\boldsymbol{\theta}))\Phi\left(\frac{\mu_{\min} - \mu(\boldsymbol{\theta})}{\sqrt{v(\boldsymbol{\theta})}}\right) + \sqrt{v(\boldsymbol{\theta})}\phi\left(\frac{\mu_{\min} - \mu(\boldsymbol{\theta})}{\sqrt{v(\boldsymbol{\theta})}}\right)$$

- $ightharpoonup \mu_{\min} := \min_{\theta} \mu(\theta)$
- \blacktriangleright Φ, ϕ CDF and PDF of standard normal

Overall Idea again

► What if we could 'predict' discrepency values we hadn't seen before?

Overall Idea again

- ► What if we could 'predict' discrepency values we hadn't seen before?
- ► For parameters 'close' to parameters we've already tried it should be easy

Overall Idea again

- ► What if we could 'predict' discrepency values we hadn't seen before?
- Use Gaussian process to predict discrepency function

About Vivax Malaria

► Has dormant liver stage on top of blood stage infection

Champagne Model Parameters

- ightharpoonup lpha : proportion of those infected but cleared of blood stage infections (through treatment)
- β : a further proportion that are also cleared of liver stage parasites, given that they were also cleared of blood stage infection (radical cure)
- \triangleright λ : the rate of infection
- $ightharpoonup \gamma_L$: rate of clearance of liver stage disease
- f : rate of relapse
- r : rate of blood stage clearance
- δ : importation rate (which we assume is 0)

Champagne ODEs

$$\begin{split} \frac{\mathrm{d}I_{\mathrm{L}}}{\mathrm{d}t} = & (1-\alpha)(\lambda I_{\mathrm{total}} + \delta)(S_0 + S_{\mathrm{L}}) + (\lambda I_{\mathrm{total}} + \delta)I_0 \\ & + (1-\alpha)fS_{\mathrm{L}} - \gamma_{\mathrm{L}}I_{\mathrm{L}} - rI_{\mathrm{L}} \\ \frac{\mathrm{d}I_0}{\mathrm{d}t} = & -(\lambda I_{\mathrm{total}} + \delta)I_0 + \gamma_{\mathrm{L}}I_{\mathrm{L}} - rI_0 \\ \frac{\mathrm{d}S_{\mathrm{L}}}{\mathrm{d}t} = & -(1-\alpha(1-\beta))(\lambda I_{\mathrm{total}} + \delta + f)S_{\mathrm{L}} + \alpha(1-\beta)(\lambda I_{\mathrm{total}} + \delta)S_0 - \gamma_{\mathrm{L}}S_{\mathrm{L}} + rI_{\mathrm{L}} \\ + & \delta)S_0 - \gamma_{\mathrm{L}}S_{\mathrm{L}} + rI_{\mathrm{L}} \\ \frac{\mathrm{d}S_0}{\mathrm{d}t} = & -(1-\alpha\beta)(\lambda I_{\mathrm{total}} + \delta)S_0 + (\lambda I_{\mathrm{total}} + \delta)\alpha\beta S_{\mathrm{L}} + \alpha\beta fS_{\mathrm{L}} \\ & + \gamma_{\mathrm{L}}S_{\mathrm{L}} + rI_0 \end{split}$$

Champagne Model Diagram

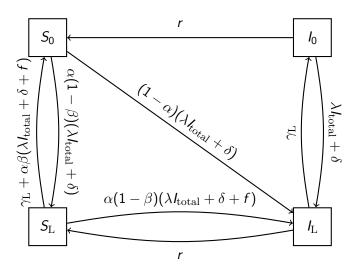

Figure: P. vivax model described by Champagne et al. 2022

Model Calibration Data

▶ Doob-Gillespie algorithm with paper parameters reported in the original paper for 'observed data', 10 initial infections, 1000 people.

Model Calibration Data

- Doob-Gillespie algorithm with paper parameters reported in the original paper for 'observed data', 10 initial infections, 1000 people.
- - w_{obs}: weekly incidence around (stochastic) equilibrium
 - p_{obs}: prevalence around (stochastic) equilibrium
 - $ightharpoonup m_{
 m obs}$: incidence in the first month of the epidemic

Model Calibration Data

- - w_{obs}: weekly incidence around (stochastic) equilibrium
 - \triangleright p_{obs} : prevalence around (stochastic) equilibrium
 - $ightharpoonup m_{
 m obs}$: incidence in the first month of the epidemic

$$D(S(\mathbf{X}), S(\mathbf{X}_{\text{obs}})) := \sqrt{\left(\frac{w_{\text{obs}} - w}{w_{\text{obs}}}\right)^2 + \left(\frac{p_{\text{obs}} - p}{p_{\text{obs}}}\right)^2 + \left(\frac{p_{\text{obs}} - p}{p_{\text{obs}}}\right)^2}$$

 \triangleright L_2 norm on the relative differences

Big Problems (Big Solutions?)

▶ Observation variance is considered constant across the GP

Big Problems (Big Solutions?)

- Observation variance is considered constant across the GP
 - Fix by modelling observation variance as another GP

Big Problems (Big Solutions?)

- Observation variance is considered constant across the GP
 - Fix by modelling observation variance as another GP
- ▶ Observation variance sometimes falls off a cliff
